(57) Abstract: The present invention is directed to novel polypeptides and to nucleic acid molecules encoding those polypeptides. Also provided herein are vectors and host cells comprising those nucleic acid sequences, chimeric polypeptide molecules comprising the polypeptides of the present invention fused to heterologous polypeptide sequences, antibodies which bind to the polypeptides of the present invention and to methods for producing the polypeptides of the present invention.

identity to the sequence of amino acid residues 1 or about 24 to about 117, inclusive of Figure 186 (SEQ ID NO:268).

5 In a specific aspect, the invention provides an isolated nucleic acid molecule comprising DNA encoding a PRO1066 polypeptide, with or without the N-terminal signal sequence and/or the initiating methionine, or is complementary to such encoding nucleic acid molecule. The signal peptide has been tentatively identified as extending from about amino acid position 1 to about amino acid position 23 in the sequence of Figure 186 (SEQ ID NO:268).

10 In another aspect, the invention concerns an isolated nucleic acid molecule comprising DNA encoding a polypeptide scoring at least about 80% positives, preferably at least about 85% positives, more preferably at least about 90% positives, most preferably at least about 95% positives when compared with the amino acid sequence of residues 1 or about 24 to about 117, inclusive of Figure 186 (SEQ ID NO:268).

15 Another embodiment is directed to fragments of a PRO1066 polypeptide coding sequence that may find use as hybridization probes. Such nucleic acid fragments are from about 20 to about 80 nucleotides in length, preferably from about 20 to about 60 nucleotides in length, more preferably from about 20 to about 50 nucleotides in length and most preferably from about 20 to about 40 nucleotides in length.

20 In another embodiment, the invention provides isolated PRO1066 polypeptide encoded by any of the isolated nucleic acid sequences hereinabove identified.

25 In a specific aspect, the invention provides isolated native sequence PRO1066 polypeptide, which in one embodiment, includes an amino acid sequence comprising residues 1 or about 24 to about 117 of Figure 186 (SEQ ID NO:268).

30 In another aspect, the invention concerns an isolated PRO1066 polypeptide, comprising an amino acid sequence having at least about 80% sequence identity, preferably at least about 85% sequence identity, more preferably at least about 90% sequence identity, most preferably at least about 95% sequence identity to the sequence of amino acid residues 1 or about 24 to about 117, inclusive of Figure 186 (SEQ ID NO:268).

35 In a further aspect, the invention concerns an isolated PRO1066 polypeptide, comprising an amino acid sequence scoring at least about 80% positives, preferably at least about 85% positives, more preferably at least about 90% positives, most preferably at least about 95% positives when compared with the amino acid sequence of residues 1 or about 24 to about 117, inclusive of Figure 186 (SEQ ID NO:268).

40 In yet another aspect, the invention concerns an isolated PRO1066 polypeptide, comprising the sequence of amino acid residues 1 or about 24 to about 117, inclusive of Figure 186 (SEQ ID NO:268), or a fragment thereof sufficient to provide a binding site for an anti-PRO1066 antibody. Preferably, the PRO1066 fragment retains a qualitative biological activity of a native PRO1066 polypeptide.

45 In another aspect, the present invention is directed to fragments of a PRO1066 polypeptide which are sufficiently long to provide an epitope against which an antibody may be generated.
